

Infinite scroll

Version 1.1.17

Description

Infinite Scroll is a module which main goal is to replace the classic pagination with some infinite pages. It means that your customers won't have to « click » in order to see other products, but simply to scroll down the page.

The module is fully compatible with Prestashop's Layered navigation block and PrestaModule's Advanced Search 4.

Prerequisites

- Prestashop version 1.5.1 to 1.6.x
- PHP version 5.2.x minimum
- Javascript enabled in the browser

Installation

The install process is strictly the same as any classic module.

- The first step is to put files on your server. You can do it directly by sending your files through your FTP or simply with the « add module » button in your back office.
- The second step is to click on the « install » button in the Modules administration page.

The module configuration is pretty easy and quick. It's divided into two main parts, each contains some options:

SETTINGS:

This part contains all of the settings concerning the module.

The screenshot shows the Prestashop back office interface for configuring the 'Infinite Scroll Premium' module. The left sidebar contains navigation links: Dashboard, Catalog, Orders, Customers, Price Rules, Modules, Shipping, Localization, Preferences, Advanced Parameters, Administration, and Stats. The main content area is titled 'Configure "Infinite Scroll Premium" module' and includes a 'SETTINGS' tab. The settings are organized into two sections. The first section, 'Enable sandbox mode', has a 'YES' button selected and a text input for 'Authorized IPs' containing '127.0.0.1'. The second section, 'Hide "We have reached the bottom end of the page" message box', has a 'YES' button selected. Below these are several toggle switches for activating infinite scroll on different page types: category, search, best-sales, new-products, prices-drop, manufacturer, and supplier. All these toggles are currently set to 'YES'. Annotations with arrows point to specific settings: 'DETERMINE IF YOU WANT OR NOT TO ACTIVATE SANDBOX MODE' points to the 'Enable sandbox mode' toggle; 'ENTER THE PATH TO ACCESS THE LOADER IMAGE' points to the 'The URL to your loader image' text input, which contains '/modules/infinite-scrolling/loader.gif'; and 'SELECT PAGES YOU WANT TO ACTIVATE THE MODULES EASILY' points to the list of page type toggles. A 'Save' button is located at the bottom right of the configuration area.

DETERMINE IF YOU WANT OR NOT TO ACTIVATE SANDBOX MODE

ENTER THE PATH TO ACCESS THE LOADER IMAGE

SELECT PAGES YOU WANT TO ACTIVATE THE MODULES EASILY

Sandbox mode:

The sandbox mode is used to authorize the module to some IP addresses. By default, the module is available only for the IP that installed the module (for e.g. 127.0.0.1) You can also add a new IP address as long as they're separated by a comma. To activate the module for everybody, you have to deactivate the sandbox mode.

Hide the ending message scrolling:

This option allows you to hide or display the message «We have reached the bottom end of this page. Go back to top.» (Yes:Hide the message, No:Display the message). We can also modify colors (border,police,background) of this message; we will see how to do it further in this documentation.

The URL to your loader image:

You can change the « loading » animation without changing any code! To do so, enter the path which allows the module to display the desired loader image. If the image is in the module's folder, put the path as shown on the screenshot. (/modules/infinitemscroll/[path to access at the image]) this path is the path by default. However, if the image is on an external link, put the link provides access to the image.

Pages implementing the module:

It will add itself automatically on every page which embed some products by default. But, you can also configure the configuration in order to make it compliant to your custom theme. You can also choose the pages where you want the module to be enabled, and last but not least, change the « loading » animation without changing any code...

ADVANCED SETTING:

This will come handy if your theme, and most specifically if the product list pages is different. Those settings can also modify colours of the ending message scrolling for this message is consistent with your theme.

ADVANCED SETTINGS

ADAPT THE MODULE TO YOUR THEME QUICKLY

The product list selector:

The single product selector:

The pagination block selector:

Background of the message box:

Police of the message box:

Border of the message box:

CHANGE THE DIFFERENT COLORS OF ENDING SCROLLING MESSAGE

CSS Selectors:

CSS product list selector: this selector is the one for the element containing the products on your pages (default : « .product_list »)

CSS product selector: this selector is the one for the product item. It must be a direct child of the product list. (default : « li.ajax_block_product »).

CSS pagination selector: this selector is the one handling the elements that must be hidden by the module. It is recommended to do it dynamically with the module (don't touch anything in your files) in order to help google finding your other pages.(default: « .bottom-pagination-content, .top-pagination-content, .nbrItemPage »)

Colors message:

Background of the message box: Allows to change the color of the background of the message. (by default: #D3D3D3 lightgrey).

Police of the message box: Allows to change the color of the police of the message. Be carefull, choose a color that doesn't confound with that of the background. (by default: #A9A9A9 darkgrey).

Border of the message box: Allows to change the color of the border of the message. Put this color at white (#FFFFFF) if you don't want to see a border. (by default: #F5F5F5 whitesmoke).

Usage

Once the module is installed, its usage is really easy. Simply go to a page where there is a product list and where the module is enabled. Scroll down the page and the products will start loading until you reach the bottom of the pages when no other products should be loaded on your current page.
